1 D.A.D DISASTER ANALYSIS DESCRIPTION

D.A.D — Disaster Analysis Description is an interactive platform designed to enhance disaster data awareness. It provides detailed insights into India’s disaster history, from cyclones to floods, through visual, analytical, and geographical perspectives.

Whether you’re a researcher, student, or policymaker, D.A.D helps uncover patterns, identify high-risk areas, and analyze disaster impacts, transforming data into actionable insights for informed decision-making.

USING MODERN WEB TECHNOLOGIES, THE PLATFORM ALLOWS USERS TO EXPLORE DISASTER DATA ACROSS TIME, LOCATION, AND TYPE.

2. KICK - KARUNYA INTREPRETER AND COMPILER KIT

KICK is a React-based online code editor with a clean, modern UI powered by Tailwind CSS. It supports **Python, JavaScript, C++, and Java** with a language selector dropdown. The interface includes a code editor, input field, and output panel to simulate code execution. Designed with a **dark theme and neon accents**, it offers an engaging coding experience. Currently frontend-only, it's built for easy **API integration**. Perfect for developers learning React or building an online code runner.

3. Deaf Quiz app

This project addresses the digital exclusion faced by deaf individuals in quiz platforms that rely on audio/text. Our deaf-friendly quiz app uses sign language images as questions, ensuring equal access to educational content. By prioritizing visual communication, we eliminate barriers while promoting inclusive design. The initiative reflects global efforts toward accessible technology, empowering the deaf community through tailored digital solutions. This innovation demonstrates how adaptive design can create equitable learning opportunities for all.

Shoutout to My React “10 Minutes a Day” Medium Posts

The “10 Minutes a Day” React learning series is a structured and self-driven initiative I started to master front-end development through consistent daily effort. The goal is simple yet powerful: spend just 10 focused minutes each day learning a new concept in React, apply it through code, and reflect on the outcome by documenting the process publicly.

This approach allows me to build my knowledge gradually without feeling overwhelmed, while also sharpening my hands-on coding skills. Over time, this method has proven to be highly effective in reinforcing core concepts, building project confidence, and staying engaged with real-world development practices. By combining theory with practical implementation, I aim to become more proficient and industry-ready, one concept at a time.

You can track my progress and read the series starting from Day 1 [here](#):
